

OpenClub is a multi-role nightlife operating system and SaaS platform designed to modernize how clubs, promoters, bottle personnel, hosts, door staff, and customers manage nightlife experiences end-to-end. The platform combines section/table reservations, GA ticketing, guest list management, CRM, referral attribution, venue operations, staff permissions, payments/payouts, and real-time event infrastructure into one connected ecosystem.

Development priority should be mobile-first across all personas. The mobile app experience should be designed and built first for customers, promoters, club management, bottle personnel, hosts, and door staff. Desktop, laptop, and tablet dashboards should then mirror the mobile experience, logic, workflows, permissions, data structures, and action flows, while adapting layouts for larger screens using responsive design and obvious device-specific constraints.

The platform includes:

- Customer-facing iOS/Android mobile app
- Club management dashboard (desktop/tablet/mobile)
- Promoter dashboard (desktop/tablet/mobile)
- Bottle personnel mobile app
- Host operational app
- Door personnel scanning app
- OpenClub SaaS admin panel

Core customer functionality includes nightlife discovery, browsing events without signup, section booking, GA passes, guest list access, referral/social flows, QR & PIN-based event entry, event widgets/lock-screen passes, Google Maps integration, split-payments for sections, invitations via SMS, social/friends functionality, promoter/club following, and personalized nightlife recommendations.

Core venue/promoter functionality includes:

- Venue onboarding + floor map builder
- Section inventory management
- Booking fee + section minimum configuration
- Dynamic pricing controls
- Event creation and operational ownership controls
- Time-slot based section management
- GA pass creation and tiering
- CRM + segmented push notifications
- Guest management
- Team/staff assignment
- Revenue projections
- Real-time operational dashboards
- Referral tracking and attribution
- Stripe/Stripe Connect payment infrastructure
- Commission and payout visibility

- Automated recommendation/action engine
- Push notification infrastructure across all personas

A foundational requirement is the referral/attribution engine. Every promoter, bottle staff member, or approved nightlife persona receives:

- One persistent foundational referral link tied to their profile
- Optional event-specific referral links

Attribution must persist across guest lists, GA passes, and section bookings, even if users navigate deeper into the app after entry.

The platform must support real-world nightlife operations and reliability at scale. Critical infrastructure requirements include:

- QR scanning + PIN fallback entry
- Offline/degraded mode support
- Cached guest lists and section data
- Re-entry logic
- Duplicate scan protection
- Fast scan/admit flows (~1.5–2.5 sec target)
- Local scan syncing after reconnect
- Emergency/manual venue mode
- Role-based permissions
- Operational continuity during outages
- High-volume nightlife concurrency handling

The admin panel is not just analytics; it is the operational trust layer of the platform. It manages:

- Clubs
- Promoters
- Events
- Sections
- Payments/payouts
- SaaS subscriptions
- Messaging infrastructure
- Entry logs
- Support/disputes
- Platform health
- Global platform rules/permissions
- Revenue visibility
- Refunds/chargebacks
- Platform-wide push notifications

OpenClub should function similarly to a hybrid between OpenTable, Eventbrite/Posh, Toast POS, and airline/event access systems — but purpose-built specifically for nightlife operations, section inventory, promoter ecosystems, and operational access control.

The primary V1 priority is NOT deep analytics. The priority is:

- Clubs can operate
- Promoters can operate
- Events can go live
- Sections can be booked
- Guests can enter smoothly
- Staff can operate quickly
- Payments/payouts are reliable
- Referral attribution is accurate
- Push notifications work
- The platform remains operational during peak nightlife hours without failure
